

Development of vermicompost for horticulture wing of JUIT

Vermicompost is organic manure and we prepare it at JUIT using *Eudrilus eugeniae* species of earthworm. Vermicompost possesses readily available nutrients and growth enhancing substances. Vermicompost is an important aspect of organic farming and leads to way to sustainable development in rural farming practices.

We are using cow dung and agricultural residue to prepare the vermicompost. A batch of vermicompost (35-40 kg) was prepared and handed over to the horticulture wing of JUIT. (01 June, 2019).
